Rate = Numerator instances of the measure OVER the denominator of the measure - for example for % of ED visits during episodes that were avoidable = Numerator - the number of ED visits that were avoidable OVER Denominator - the number of total ED visits.

Performance = A measure of the physician's probability of doing better than their actual observed measure outcome. If a provider/PGs performance rating was at a 90% for example, we would say that they had a 10% probability of performing better given the demographics and health factors of their patient population.

Percentile = This is how a provider's Performance compares across specialty and CBSA. For example, if a provider/PGs is at the 75th percentile for the measure % of admits during episodes that had a readmit, then they performed better than 75% of their peers in the same specialty and CBSA
